Welcome to today’s session!

Take a moment to locate the chat box and answer the question below:

What is your hometown?
What grade level do you teach/work with?
Orthographic Mapping
How Do We Learn New Words?

Sarah Rollins
Literacy Coach

Bethani Welch
Regional Literacy Coordinator

Zach Williams
Literacy Coach
1. ALL Students Proficient and Showing Growth in All Assessed Areas

2. EVERY Student Graduates from High School and is Ready for College and Career

3. EVERY Child Has Access to a High-Quality Early Childhood Program

4. EVERY School Has Effective Teachers and Leaders

5. EVERY Community Effectively Uses a World-Class Data System to Improve Student Outcomes

6. EVERY School and District is Rated “C” or Higher
To create a world-class educational system that gives students the knowledge and skills to be successful in college and the workforce, and to flourish as parents and citizens.

To provide leadership through the development of policy and accountability systems so that all students are prepared to compete in the global community.
Session Norms

• Mute your audio.
• Check and respond to emails after our live session.
• Do not hesitate to drop questions in the chat box.
Session Goals

1. Define orthographic mapping and examine the research.
2. Explore the relationship between unitization, sight words, and fluency.
3. Learn ways to teach orthographic mapping.
4. Discuss orthographic mapping activities in the classroom.
Type up to three words that come to mind when you hear "Orthographic Mapping."

https://www.menti.com/t8fqkohwx
Phonological & Orthographic Processors
The Brain:

- Reads by breaking words into sounds.
- Is naturally wired for speech, but not for reading.
- Relies on other systems already in place, mostly in the brain’s language center, to work together to read.
Phonological & Orthographic Processors

(Seidenberg & McClelland, 1989)
The phonological and orthographic processors work together for word recognition.

**Orthographic Processor**
- Identifies and processes the letters and letter patterns that our eyes see on the page.
- Helps us remember letter sequences for spelling.

**Phonological Processor**
- Identifies, remembers, interprets, and produces speech sounds.
- Phoneme awareness is just one of the jobs of the phonological processor.
Automatic word recognition (identifying a word “on sight”) happens after the word is read and mapped over and over, and neural connections have gotten stronger and stronger.

For some children, this happens quickly after only a few repetitions, while with others, it takes seemingly endless (possibly hundreds of) exposures.

(Paul, 2020)
• After students have mastered many words (meaning they have stored those letter patterns in their own mental lexicon), then they can begin to read using these familiar patterns.

• They may be quicker to read “p-an” and “m-an” because they have read “can” so many times and have “mapped” the letters a-n to the pronunciation “an.”
Defining Orthographic Mapping and How it Works
Defining Orthographic Mapping

• According to Kilpatrick (2021), good readers can access around 50,000 words on sight without any conscious effort.

• No one consciously memorizes that many “sight” words, so cognitive processes must be occurring “behind the scenes” making it possible to instantly access that many words.

• Orthographic mapping describes the “behind the scenes” processes of mapping sounds to letters resulting in automatic retrieval.
Defining Orthographic Mapping

- **Orthography** refers to the conventions in a spoken language that are used to represent its words in writing.
- **Mapping** is connecting *sounds* in words to letters/spellings in *print*.

**Ortho** = straight (think of orthodontist)

**Graph** = writing

Meaning: Correct Writing
Defining Orthographic Mapping

Two Levels of Word Reading

**Phonemic Decoding**
- Sounding out words
- Letter-sound knowledge
- Phonemic knowledge/blending

**Orthographic Mapping**
- Remembering words
- Letter-sound proficiency
- Phonemic analysis proficiency
Defining Orthographic Mapping

Orthographic Mapping is the mental process we use to store words for immediate, effortless retrieval. It requires **phoneme proficiency** and **letter-sound proficiency**, as well as the ability to unconsciously or consciously make connections between the oral sound in spoken words and the letters in written words.

(Kilpatrick, 2016)

Orthographic mapping is the process by which children move from **decoding alphabetically** to reading via the **fluent recognition** of individual words.

How to Promote Orthographic Mapping

• “Typically developing readers will naturally analyze any whole word phonemically and establish an orthographic representation of that word.” (Kilpatrick 2015)

• Some students will require guided practice with advanced phonemic analysis.

• **Weak readers** do *not* naturally engage in orthographic mapping because they lack those advanced phonemic awareness skills.
How to Promote Orthographic Mapping

Develop Automatic Processes

• Train letter-sound skills to proficiency/automaticity
• Train phonemic access skills to proficiency/automaticity

If phonemic skills do not fully develop, word reading is compromised. They are the foundation for letter sound knowledge and letter sound proficiency.

(Kilpatrick, 2021)
# How NOT to Promote Orthographic Mapping

## Table

<table>
<thead>
<tr>
<th>What We Teach:</th>
<th>What Our Students Do:</th>
<th>What They Learn:</th>
</tr>
</thead>
<tbody>

</table>

(Right to Read Project, 2019)
Unitization, “Sight Words,” and Fluency
“If a child memorizes ten words, the child can read only ten words, but if a child learns the sounds of ten letters, the child will be able to read 350 three sound words, 4320 four sound words and 21,650 five sound words.”

Dr. Martin Kozloff (2002)
UNITIZATION occurs when our brains form connections between the pronounced phonemes in a word and the order of graphemes or printed letters in the word.

The brain maps the SOUNDS of a word to the visual SEQUENCE of letters on the page, and those letters become UNITIZED – known as a unit.

/alk/  walk  talk  balk
Unitization, “Sight Words,” and Fluency

How do you pronounce this nonsense word?

nalk

Did your pronunciation rhyme with the word chalk or talc?
UNITIZATION is the rocket fuel that propels sight word development.

The Brain:

- Permanently identifies each letter in the word
- Recognizes the units automatically

Photograph – Phonograph

House – Horse
Once a sight word is learned, it is impossible for your brain to suppress it. Pronunciation and meaning are activated instantaneously.

**“SIGHT WORDS”** = Words that our brain have mapped and can be retrieved instantaneously.

- Once a sight word is learned, it is impossible for your brain to suppress it.
- Pronunciation and meaning are activated instantaneously.

All work together to allow immediate access to words.

These 3 parts work together to allow immediate access to words.
How Words Become “Sight Words” 32

- The orthographic lexicon will develop as a child learns to read. Students will learn the exact letter sequence of words, which will then be recognized "by sight" without needing to be sounded out.
- Letter-sound skills and phonemic analysis skills will help students map the sequence of letters onto the pronunciation of words.
- The spelling of c-a-t becomes linked to the pronunciation and meaning that is already stored in that child's brain for years.

(The Reading League, 2017)
• When students are first learning to read, they are attempting to decode most words sound by sound.

• As they read more, they start to recognize words “on sight” without having to decode.

• They need to store these letter sequences correctly (for word recognition) through orthographic mapping.

(The Reading League, 2017)
Independent Activity- The Stroop Effect

The Stroop Effect

Directions: On the next slide, name the color of each word you see. Do not read the words! You will have thirty seconds to name all the colors.

</tbody>
</table>
The Stroop Effect

Selective Attention Theory:
• The brain uses more attention to recognize a color than to read a word.
• Naming the actual color takes longer than reading the text.

Speed of Processing Theory:
• The brain reads words faster than it recognizes the colors.
• The speed at which we read makes it much more difficult to name the color without a lag.
Automaticity:

• The brain automatically understands the meaning of words through a long-time habit of reading, but recognizing colors is not an automatic process.

• The brain must override its initial impulse of automatically reading the word in order to recognize the color.
The Stroop Effect

• We will view "The Stroop Effect" video.
• While we view the video, please jot down items that stand out to you and how this relates to orthographic mapping.
• After the video is complete, you will have 2 minutes to drop your comments in the chat.

The Stroop Effect Video
The Beauty of “Sight Words” and Unitization

Automatic and accurate recognition of words eases the burden of reading, makes it more enjoyable, and frees up cognitive resources to think and learn.

- The key to building fluency is orthographic mapping.
- Establishing “sight words” leads to **fluency**.

(Joan Sedita, 2020)
Skills Needed for Orthographic Mapping

• Beginning readers in kindergarten and 1st grade are developing their knowledge of letter-sound correspondences and basic phonemic awareness skills and are beginning to decode.

• Before a student can orthographically map a word, the word first must be identified. Young students identify the pronunciation of a word by using their letter-sound knowledge to determine each sound in the word, and then using their phonemic blending skills to blend those sounds to decode (sound out) the word.

• Typically, by grade 3, orthographic mapping usually develops for most students simply by interacting with letters and words.
Orthographic Mapping Activity (Pre-K, K Phonological Skills)
Sound-Symbol Awareness is explicitly teaching and reviewing graphemes (letter name, letter sound, letter formation).
Sample Kindergarten Phonemic Awareness Activity:

• Teacher- “Segment the word *map*.”
• Students- Push the chips as they say /m/ /a/ /p/.
• Teacher- “Take away the /m/. What do you have now?”
• Students- "/ap/"
• Teacher- Give students new bingo chip and say, “This is /s/.” I would place it where the /m/ was and ask, “now what is the word?”
• Students- "/sap/"
Orthographic Mapping Activity (K-1 Word Reading)

1. Say the word. Student repeats the word.
2. Finger spell to count the phonemes. To finger spell, use one finger per phoneme like you are counting.
3. Repeat by tapping on or moving something concrete, like these chips.
4. Build the word with letter tiles. Repeat the word matching the sound dots to the letters.
5. Ask questions that point out the sequence of letters. (*Which letter says /g/? Where is that letter in the word?*)
Sample 3rd Grade Phonemic Awareness Activities

Deleting: Say 'stow' without /t/. (sow)

Substituting: Say 'stow'. Now say 'stow' and change the /t/ to /l/. (slow)

Reversing: Say 'chap'. Now say the sounds in 'chap' in reverse. What do you get? (patch)

• These tasks are more highly correlated with word-reading than simple segmentation.
How to Promote Orthographic Mapping

• For struggling readers in 2\textsuperscript{nd} and 3\textsuperscript{rd} grades who do not naturally develop advanced phonemic awareness skills through exposure to classroom literacy activities, orthographic mapping is difficult.

• Research suggests that advanced phonemic awareness skills and phonics should be directly taught for these students to become proficient readers.

• Interventions that allow students to complete their phonological awareness development (along with teaching and reinforcing phonics skills and phonic decoding and providing opportunities for reading connected text) produce very large gains in word-level reading skills.
How to Promote Orthographic Mapping

• Phonics and phonemic awareness instruction must be explicit and systematic.

• Lessons should provide adequate practice and immediate feedback.

• Instruction should provide many practice opportunities.

• Distributed learning is better than massed learning.

• Language of instruction must be mastered.

• Motivation is important – Activities should be fast paced, fun, and brief.

(Kilpatrick, 2021)
Key Take-Aways

• Orthographic mapping is the mental process by which readers store written words for immediate, effortless retrieval.

• Sight words are words that are stored through orthographic mapping and recognized instantly without decoding. Sight words are NOT words that are typically memorized because of irregular spelling patterns.

• Letter sounds proficiency, phonological proficiency, and pronunciations of words from the phonological lexicon are pre-requisites for orthographic memory and sight word vocabulary.

• Advanced phonemic awareness proficiency is needed for orthographic mapping (deleting, substituting, reversing) and can be completed during whole group and small group instruction.
